Worksheet & Answer Key

In humans, transportation refers to the process by which oxygen and nutrients are carried to cells and waste products are removed. This is achieved through a network of blood vessels including _____ (arteries), capillaries, and veins. The _____ (heart) pumps blood throughout the body, allowing for efficient transport of essential molecules.

Word Bank:

arteries, heart

Fill in the blanks:

1. Circulation in humans involves the process by which oxygen and nutrients are carried to cells and waste products are removed through a network of blood vessels including _____.

2. The _____ (heart) pumps blood throughout the body, allowing for efficient transport of essential molecules.

3. Humans have a network of blood vessels including _____, capillaries, and veins that facilitate transportation.

4. Oxygen and nutrients are carried to cells in humans through a process called _____.

5. Waste products are removed from human cells through the process of _____.

6. The _____ (heart) plays a crucial role in facilitating circulation in humans.

7. Humans rely on their _____ (arteries) to carry oxygenated blood away from the heart and to other parts of the body.

8. Blood vessels, including _____, capillaries, and veins, work together to facilitate transportation in humans.

9. The process of transportation in humans allows for efficient delivery of essential molecules to cells throughout the body.

■ Answer Key (for teachers only):

1. arteries
2. heart
