Paragraph: In humans, transportation refers to the process by which oxygen and nutrients are carried to cells and waste products are removed. This is achieved through a network of blood vessels including _____ (arteries), capillaries, and veins. The _____ (heart) pumps blood throughout the body, allowing for efficient transport of essential molecules.

Answer bank: ARTERIES, HEART

Q1... Circulation in humans involves the process by which oxygen and nutrients are carried to cells and waste products are removed through a network of blood vessels including _.

Q2... The _ (heart) pumps blood throughout the body, allowing for efficient transport of essential molecules.

Q3... Humans have a network of blood vessels including _, capillaries, and veins that facilitate transportation.

Q4... Oxygen and nutrients are carried to cells in humans through a process called _.

Q5... Waste products are removed from human cells through the process of _.

Q6... The _ (heart) plays a crucial role in facilitating circulation in humans.

Q7... Humans rely on their _ (arteries) to carry oxygenated blood away from the heart and to other parts of the body.

Q8... Blood vessels, including _, capillaries, and veins, work together to facilitate transportation in humans.

Q9... The process of transportation in humans allows for efficient delivery of essential molecules to cells throughout the body.
