Worksheet & Answer Key

Spherical mirrors are used to produce a real, inverted image on a screen. The mirror formula and magnification are important concepts in understanding how these mirrors work. The mirror formula is given by _____, where R is the radius of curvature, f is the focal length, and p is the distance from the mirror to the object. This formula can be used to calculate the image distance, which is dependent on the object distance. The magnification of a spherical mirror depends on the ratio of the image height to the object height. When the object is placed within two F's, the image is real and inverted.

Word Bank:

image, dependent, formula, height, object, distance, inverted, real

Fill in the blanks:

1. Spherical mirrors are used to produce a _____, inverted image on a screen.
2. The mirror formula is given by _____, where R is the radius of curvature, f is the focal length, and p is the distance from the mirror to the _____.
3. This formula can be used to calculate the _____, which is dependent on the object _____.,
4. The magnification of a spherical mirror depends on the ratio of the _____ height to the _____ height.
5. When the _____ is placed within two F's, the image is _____ and inverted.

■ Answer Key (for teachers only):

1. real
2. formula
3. object
4. image
5. dependent
6. object
7. inverted
8. real
