Worksheet & Answer Key

When light passes from air into a rectangular glass slab, it undergoes _____ due to a difference in the speed of light between the two media. This phenomenon is known as refraction through a transparent medium like glass or plastic. The angle at which the light bends as it enters the glass slab is determined by the refractive indices of both the air and the glass.

Word Bank:

angle, bends, medium, phases, refracts, speeds, slab, trans

Fill in the blanks:

1. Light _____ as it passes from air into a rectangular glass slab.
2. The angle at which light _____ is determined by the refractive indices of both media.
3. When light passes from air into a rectangular glass slab, it undergoes _____.
4. The speed of light changes as it _____ from one medium to another.
5. Light travels at different _____ in air and a transparent medium like glass.
6. The shape of the _____ remains unchanged during refraction.
7. Refraction occurs due to a difference in the _____ of light between media.
8. Light bends as it enters the _____.
9. The refractive indices of both air and the glass _____ determine the angle at which light bends.

■ Answer Key:

1. refracts

2. bends

3. medium

4. phases

5. refracts

6. speeds

7. slab

8. trans
