Worksheet & Answer Key

When light passes from one medium to another, it bends due to refraction. A lens can form an upright image or an inverted image depending on whether the object is placed closer or farther away. The shape and size of the lens affect the magnitude and direction of this bending, resulting in a formed image. Typically, concave lenses produce virtual images, while convex lenses create real images.

Word Bank:

convex, refraction, lenses, medium, inverted, upright, concave, bends

Fill in the blanks:

1. The shape and size of the _____ affect the magnitude and direction of this bending, resulting in a formed image.

2. When light passes from one medium to another, it _____ due to refraction.

3. A lens can form an _____ image or an inverted image depending on whether the object is placed closer or farther away.

4. Typically, _____ lenses produce virtual images, while convex lenses create real images.

5. The _____ of a lens affect the magnitude and direction of this bending, resulting in a formed image.

6. A _____ lens can form an upright image or an inverted image depending on whether the object is placed closer or farther away.

7. When light passes from one medium to another, it bends due to _____.

8. _____ lenses create real images while concave lenses produce virtual images.

■ Answer Key (for teachers only):

1. lenses
2. refraction
3. lenses
4. inverted
5. upright
6. concave
7. bends
8. convex
