Worksheet & Answer Key

Metals towards the top of the reactivity series can be extracted using various methods. The most common method is electrolysis, which involves passing an electric current through a molten or dissolved substance to separate the metal ions from other substances. This process is often used to extract metals like _____ (1) and _____ (2), which are found in low concentrations in their ores. By using this method, it's possible to obtain high-purity metals that can be used for various applications.

Word Bank:

sodium, aluminum, reactive, electrolysis, molten, ions, substances, purify

Fill in the blanks:

1. Metals towards the top of the reactivity series can be extracted using various _____.

2. The most common method is _____, which involves passing an electric current through a _____ substance to separate the metal ions from other substances.

3. This process is often used to extract metals like _____ and _____, which are found in low concentrations in their ores.

4. By using this method, it's possible to obtain high-_____ metals that can be used for various applications.

5. The process of electrolysis helps to _____ metals from other substances.

6. Metals towards the top of the reactivity series can be extracted using various methods and then _____ to remove impurities.

7. Electrolysis is often used to extract metals like _____ and copper from their ores.

8. By using this method, it's possible to obtain high-purity _____ that can be used for various applications.

9. The process of electrolysis helps to separate the metal ions from other _____.

■ Answer Key (for teachers only):

1. electrolysis
2. aluminum
3. reactive
4. electrolysis
5. purify
6. reactive
7. sodium
8. purify
