Instructions for filling the sheet:
• Don't fold the sheet. Use only ball pen. Read the given paragraph carefully.
• Below the paragraph, you will find questions with blanks.
• Use the Answer Bank provided to fill in the blanks with the most appropriate word(s).
• Each word/phrase from the Answer Bank can be used only once, unless stated otherwise.
• Write only the correct word(s) in the blank space provided.
• Spelling errors may result in the loss of marks.
• Do not use words that are not in the Answer Bank.
• **Only use *UPPER CASE CAPITAL LETTER ALPHABETS* in the boxes.**

Paragraph: Metals towards the top of the reactivity series can be extracted using various methods. The most common method is electrolysis, which involves passing an electric current through a molten or dissolved substance to separate the metal ions from other substances. This process is often used to extract metals like _____ (1) and _____ (2), which are found in low concentrations in their ores. By using this method, it's possible to obtain high-purity metals that can be used for various applications.

Answer bank: SODIUM, ALUMINUM, REACTIVE, ELECTROLYSIS, MOLTEN, IONS, SUBSTANCES, PURIFY

Q1. Metals towards the top of the reactivity series can be extracted using various

_.

Q2. The most common method is

_, which involves passing an electric current through a _ substance to separate the metal ions from other substances.

Q3. This process is often used to extract metals like

_ and _, which are found in low concentrations in their ores.

Q4. By using this method, it's possible to obtain high-

_ metals that can be used for various applications.

Q5. The process of electrolysis helps to

_ metals from other substances.

Q6. Metals towards the top of the reactivity series can be extracted using various methods and then

_ to remove impurities.

Q7. Electrolysis is often used to extract metals like

_ and copper from their ores.

Q8. By using this method, it's possible to obtain high-purity

_ that can be used for various applications.

Q9. The process of electrolysis helps to separate the metal ions from other

_.
