Instructions for filling the sheet:

- Don't fold the sheet. Use only ball pen. Read the given paragraph carefully.
- Below the paragraph, you will find questions with blanks.
- Use the Answer Bank provided to fill in the blanks with the most appropriate word(s).
- Each word/phrase from the Answer Bank can be used only once, unless stated otherwise.
- Write only the correct word(s) in the blank space provided.
- Spelling errors may result in the loss of marks.
- Do not use words that are not in the Answer Bank.
- **Only use *UPPER CASE CAPITAL LETTER ALPHABETS* in the boxes.**

Paragraph: The Earth's atmosphere bends light as it enters our eyes, a phenomenon known as atmospheric refraction. This is because air molecules have a slightly different density than the surrounding air, causing light to bend and change direction. As light travels through the air, it passes through layers of different densities, with each layer having its own unique refractive index. This bending effect allows us to see far-off objects more clearly, as the light from those objects has been refracted or bent towards our eyes. In addition to this correctional role, atmospheric refraction also plays a part in the spectacular displays of colorful sunsets and sunrises we enjoy on clear days.

Answer bank: CURVES, LAYERS, DENSITY, BENDS, REFRACTS, CLEARS, OBJECTS, SURFACES

Q1. A __ bends light as it enters our eyes.

Q2. The Earth's atmosphere _ light as it enters our eyes.

Q3. As light travels through the _, it passes through layers of different densities.

Q4. This bending effect allows us to see far-off _ more clearly.

Q5. The refractive index changes as we move through _.

Q6. In addition to this correctional role, atmospheric refraction also plays a part in the spectacular displays of colorful _.

Q7. Light from far-off _ has been refracted or bent towards our eyes.

Q8. This is because air molecules have a slightly different _ than the surrounding air.
